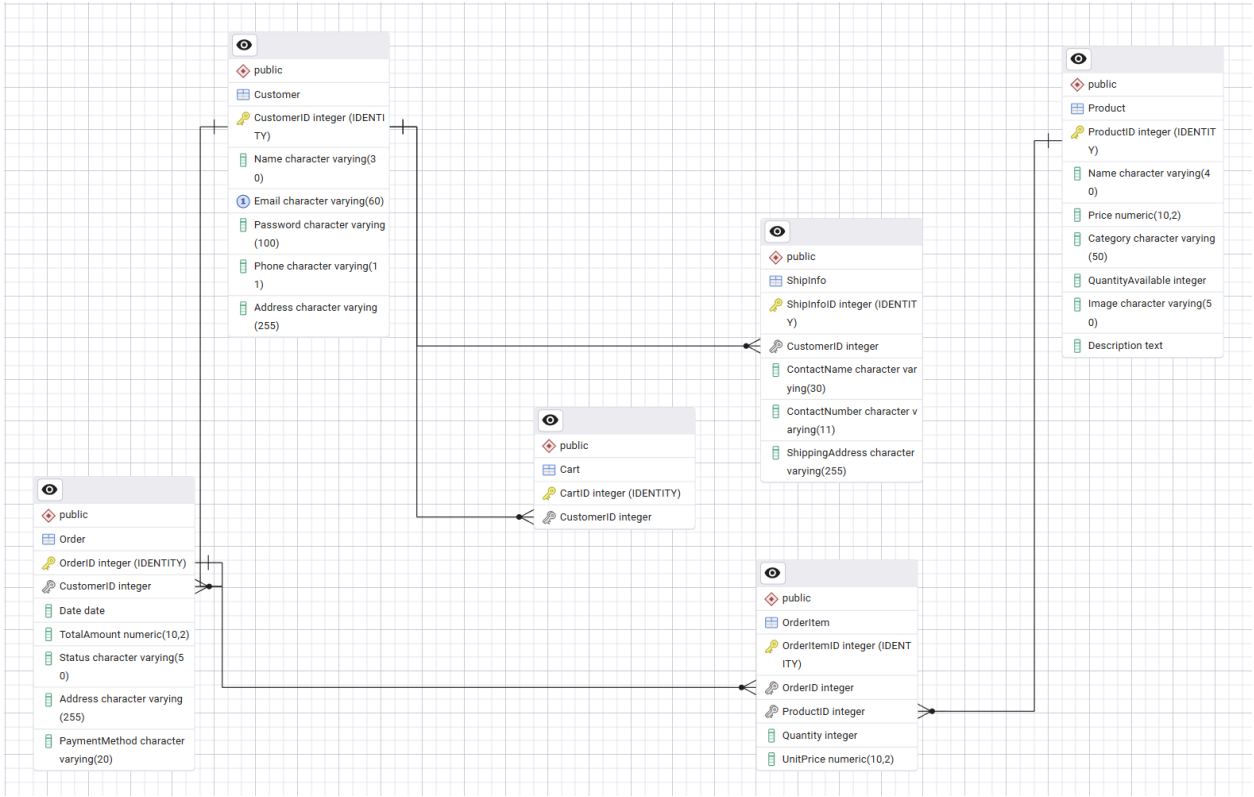
- **Student Name 1: Lê Hữu Lâm Thư**
- **Student ID 2: B2206007**
- **Student Name 2: Dương Đông Quang**
- **Class/Group Number (e.g, CT313HM01): CT313HM01**

I. Introduction

NeoStyle Watch Shop is a modern e-commerce platform designed for browsing and purchasing stylish watches. It offers a responsive user interface and seamless shopping experience powered by Vue.js on the frontend and a RESTful API with PostgreSQL on the backend.

- Project/application description:
  + Frontend: Vuejs, Bootstrap, javascript, pinia
    . Bootstrap for responsive web page
    . Router link for redirection
  + Backend: RESTful API, CRUD Operations, PostgreSQL, rate-limit

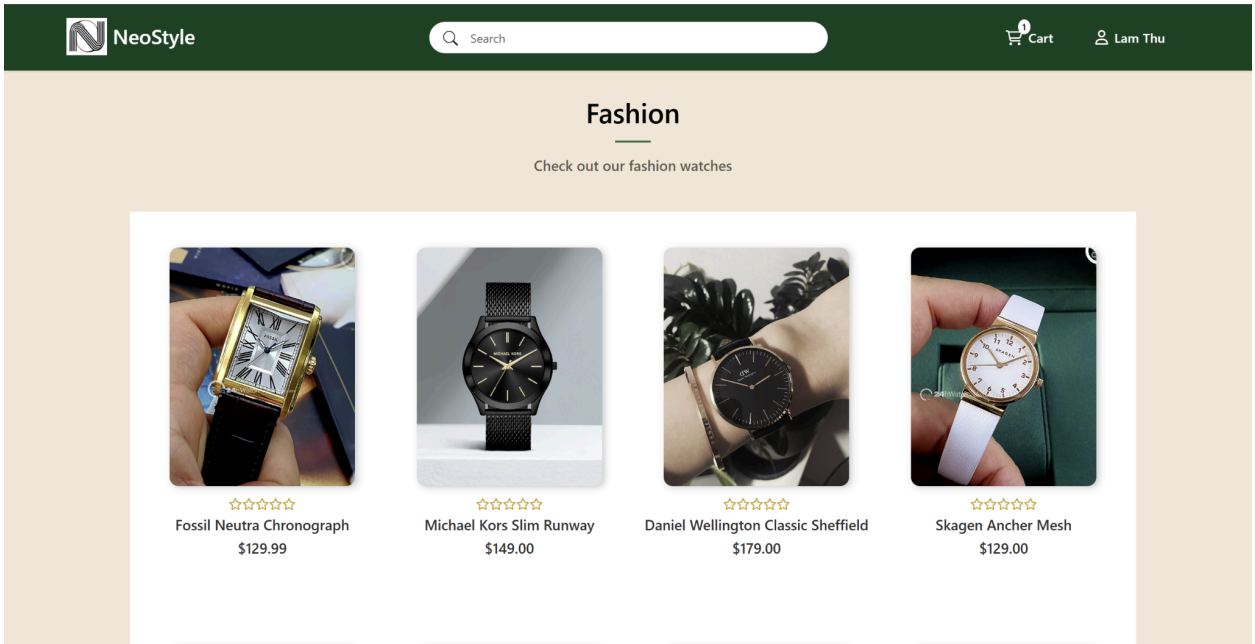
- Tables and their structures in the database

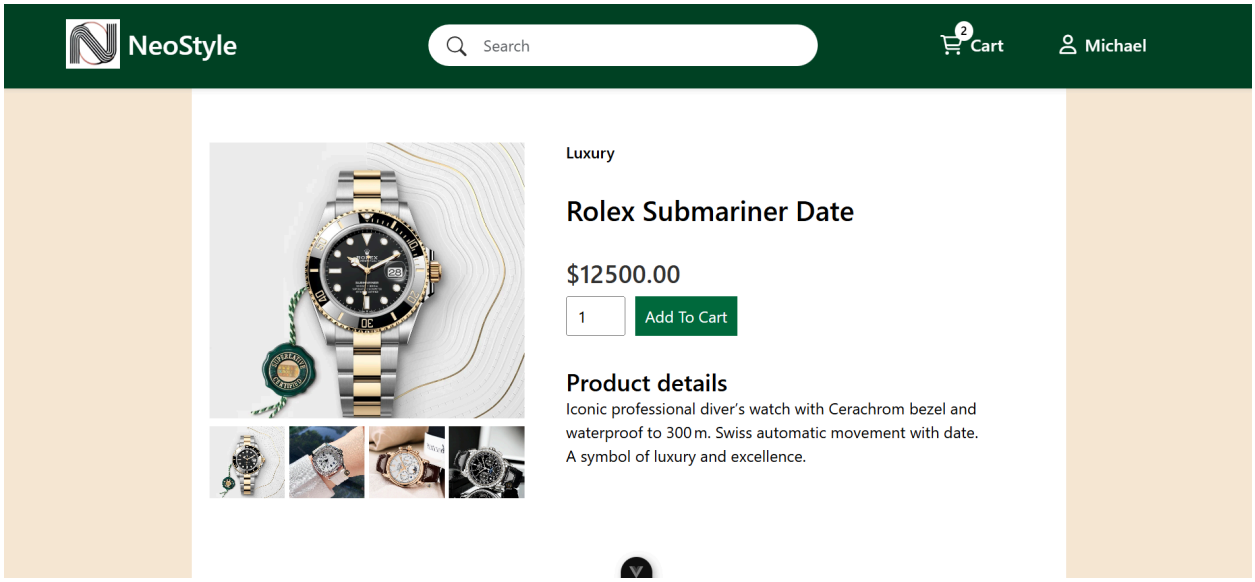


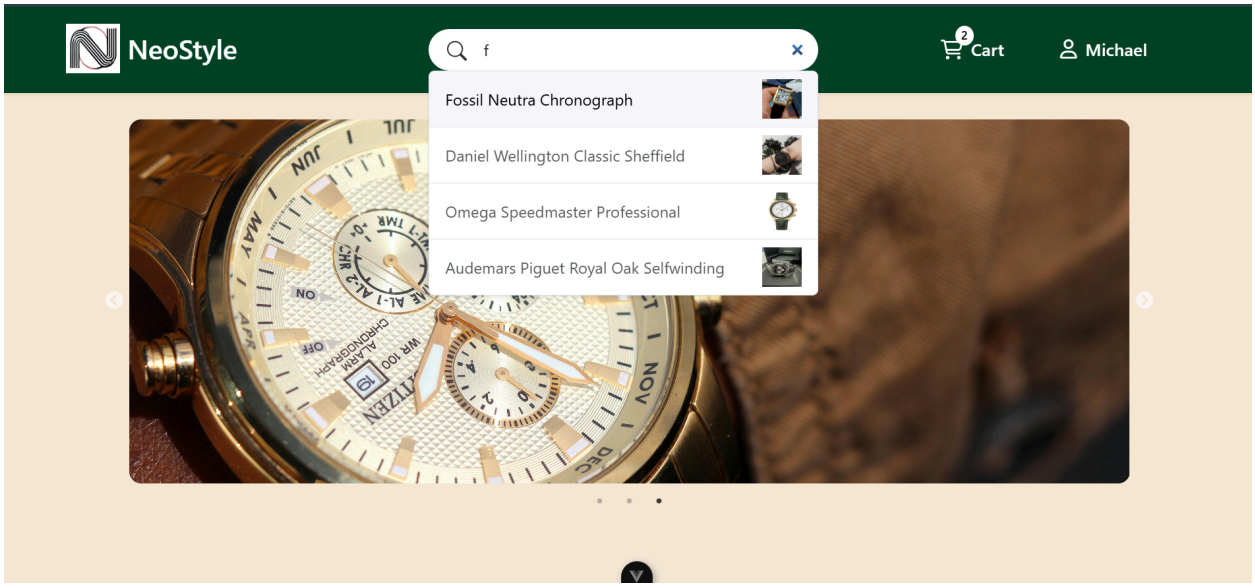
II. Details of implemented features

1. Home:

- **Description:** Show up-to-date products and search products







Product APIs (Endpoint: /api/v1/products):

- GET : List all products
- GET: Get product by ID
- GET: Search products by name

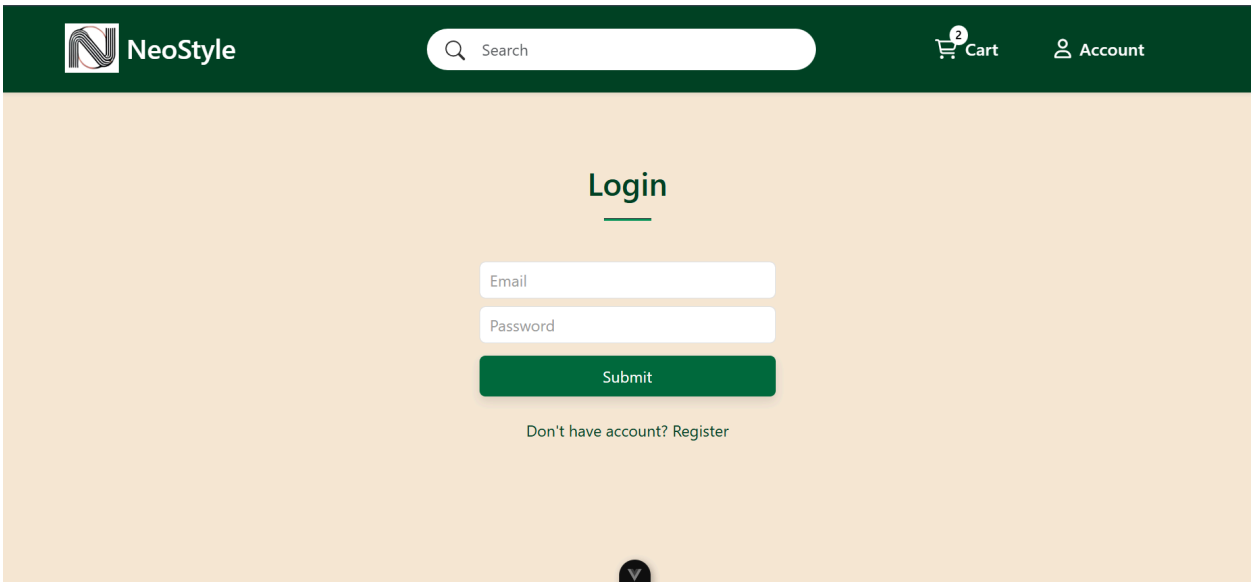
Data format: multipart/form-data

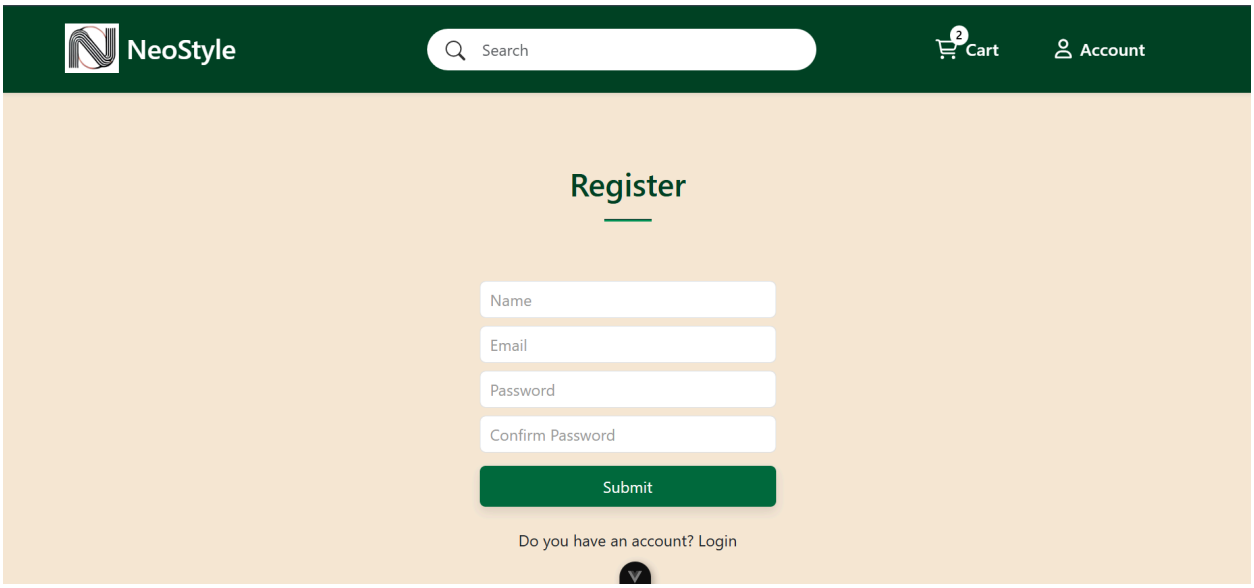
Data read/write: APIs read product table.

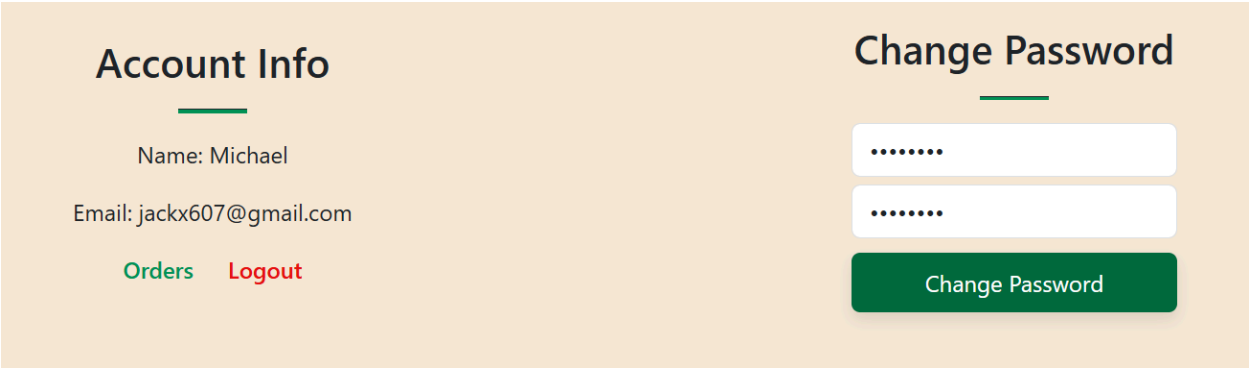
Client-state: Cart

2. Login / Signup

- **Description:** Log in / register new user







Customer APIs (Endpoint: /api/v1/customers):

- GET : Get customer by ID
- POST: Create a new customer
- POST: Check for customer
- PUT: Update customer by ID

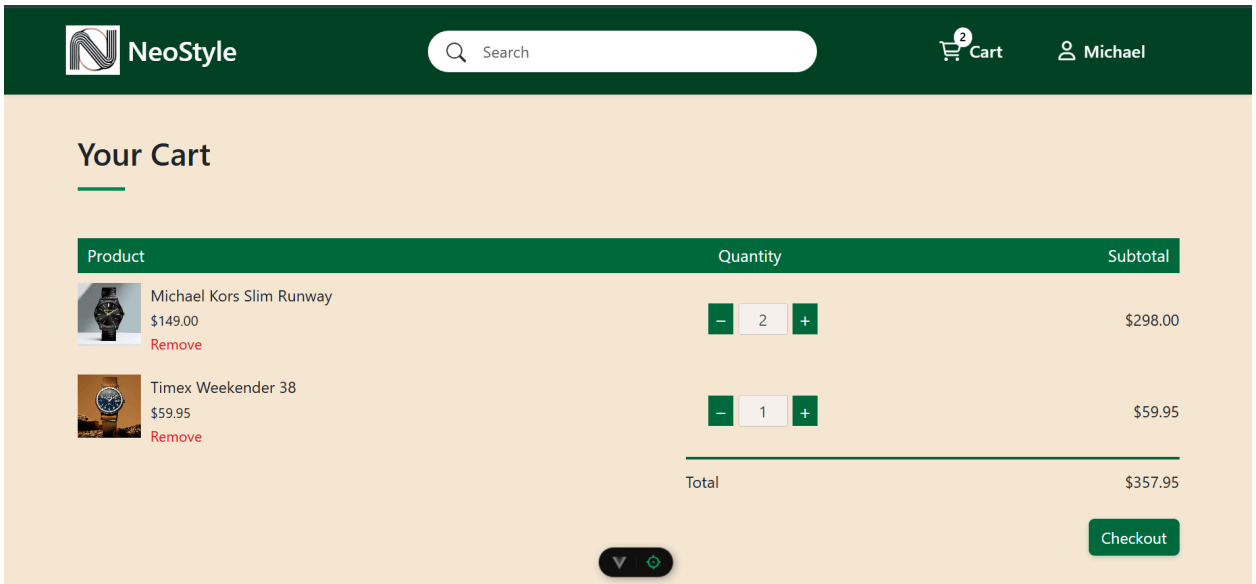
Data format: multipart/form-data

Data read/write: APIs read/write customer table.

Client-side state: customer email and customer password

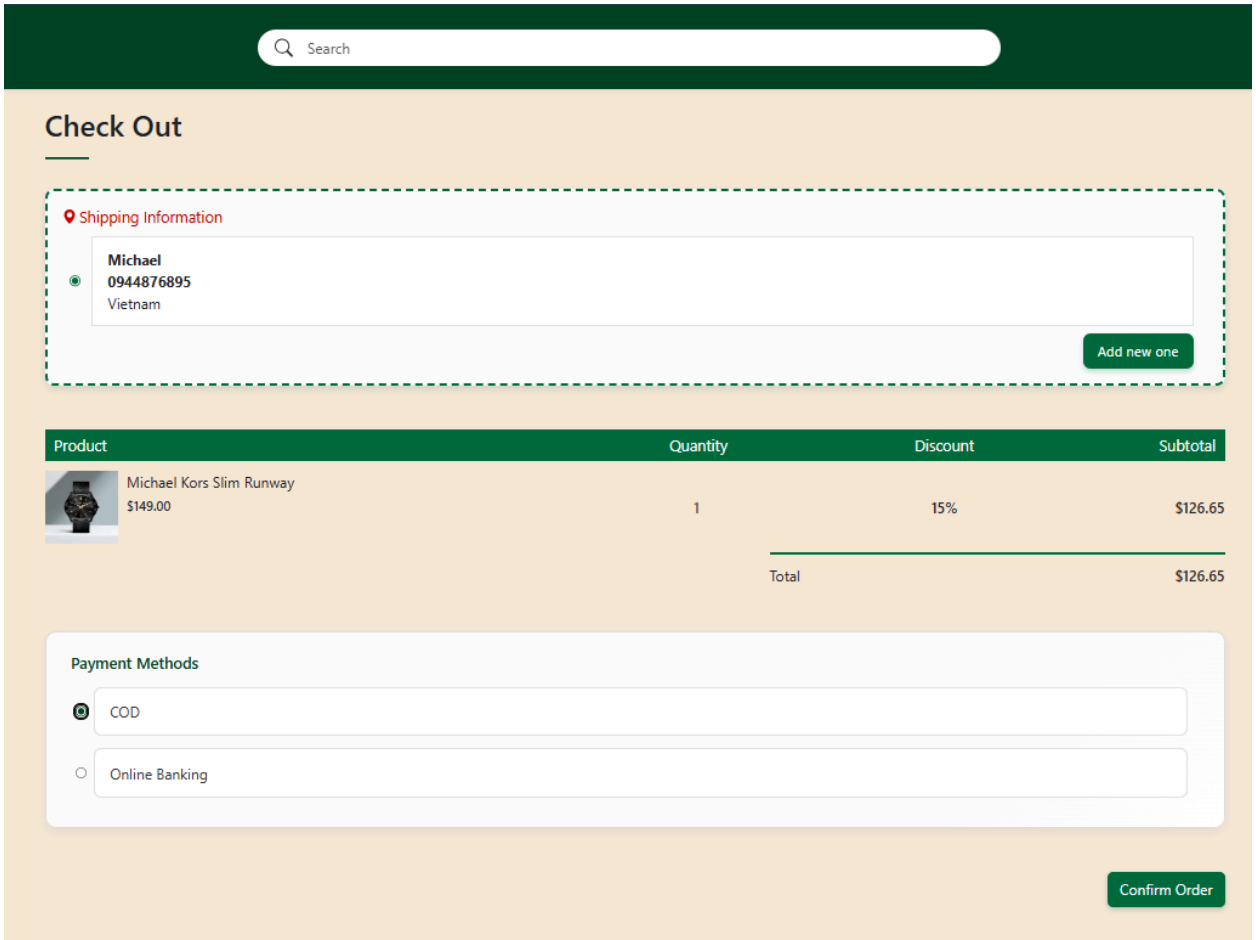
3. Cart

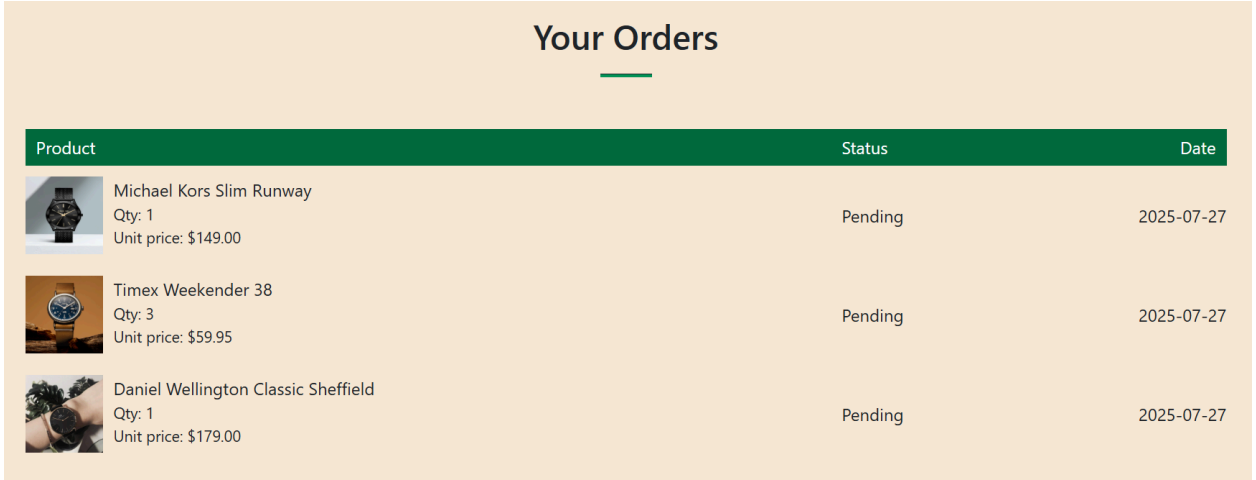
- Description: Display and allow users to edit the amount of selected products. Users can increase, decrease the amount of products or delete selected products from the cart. If they push on checkout button, they'll be redirected to payment page and all the selected products in current cart will be deleted



4. Order

- **Description:** Create order for customer.





Order APIs (Endpoint: /api/v1/orders):

- POST: Create a new order
- GET: Get order by id customer

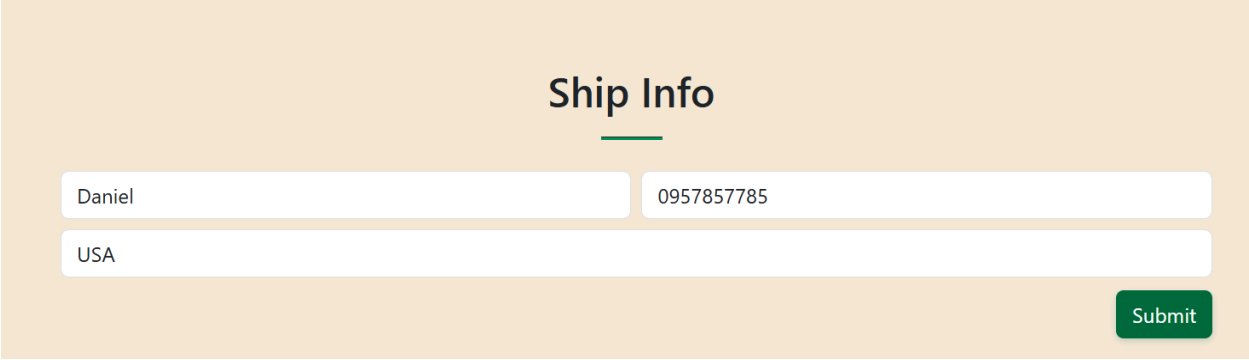
Data format: application/json and formdata

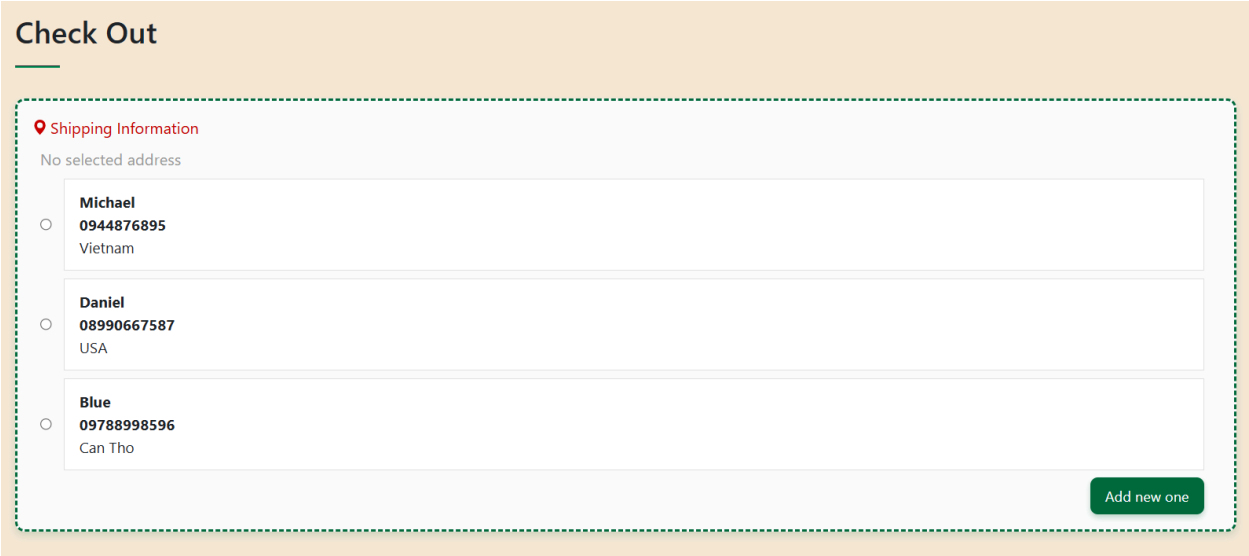
Data read/write: APIs read/write Order and OrderItem table.

Client-state: Cart, Customer id

5. **Shipinfo:**

Description: Create ship info of user for delivery





ShipInfo APIs (Endpoint: /api/v1/shipinfo):

- POST: Create a new shipping info
- GET: Get shipping info for customer

Data format: multipart/form-data

Data read/write: APIs read/write Shipinfo table.
